EDO Programming
Emergency DMX Override

For egress or emergency lighting triggered by an external contact.
Connecting EDO to Common with an external contact overrides the incoming DMX signal and forces all breakers to the pre-programmed EDO state.

## How to program EDO

A. Turn the DMX CONTROL POWER off.
B. Note the DMX Starting Address
C. Move jumpers to reset the DMX

STARTING Address to 555.
D. Turn the DMX CONTROL POWER on. The board will scan through the breakers 1 thru 10 and display the previous EDO settings if there are any stored in memory. All numbered LEDs that were on when the EDO setting was stored will light.
E. Press the green EDO ON-OFF Toggle button once.
The \#1 breaker LED will flash;
Fast for ON - Slow for OFF.
Toggle the same green button to the desired state of the \#1 breaker.
F. Advance to breaker \#2 with the red EDO Advance button. (\#1 now indicates the condition you left it in. Lit = ON)
G. Set the rest of the positions, having breakers connected, to your desired EDO condition. Finish your settings with one more EDO Advance keystroke. All breaker LEDs will indicate their EDO state. If you change your mind, you can loop back to 1 with another Advance keystroke. \#1 will begin flashing again to indicate it's ready to edit.
H. To store your EDO settings, turn DMX CONTROL POWER off and wait until the large red LED extinguishes.
I. Reset the DMX Starting Address jumpers to the one remembered in step $B$.
J. Turn on DMX CONTROL POWER. Now whenever you connect the EDO terminal to common, the red EDO LED will light and your stored EDO settings will override any DMX commands until the emergency contact is opened.
If you have programmed Post EDO, all circuits will go to that scenario when the emergency contact is opened.
With no Post EDO program all breakers default to off and will require another DMX command to actuate.
You have the option to program the Post EDO condition to reset the breakers to a different condition when the EDO contacts are reopened.
How to program Post EDO
K. With power off, move jumpers to reset the DMX Starting Address to 599.
Return to step D. to program Post EDO.

## How it works

The DMX CONTROL POWER circuit breaker powers the control circuit boards via a 24 volt transformer.
Motorized circuit breakers (face-marked REMOTELY OPERATED) are individually actuated by a low-voltage command from a remote DMX control device. (light board)

Each of the numbered LEDs, 1 thru 10, indicate the status of the attached breaker.
Lit $=\mathrm{ON}-$ Unlit $=$ OFF
Flashing = A command execution is in progress.

Each circuit board controls up to ten 1, 2 or 3 pole motorized circuit breakers.

Each motorized breaker acts as a circuit protection device as well as a remotely operated switch. The breaker handle
moves only when over-current-tripped or manually turned off.
Master and Slave control boards are used depending upon the number of DMX universes served. (Slaves have no DMX input or output components).
DMX signals are fed to the Master board/s from the appropriate DMX universe.
Power, DMX and EDO data are daisy-chain fed board-to-board by the yellow jumper connectors.
(EDO = Emergency DMX Override)
The STARTING DMX address is set for each board by jumpers. Depending on the results of a power-up-scan, consecutive DMX addresses are only used for the headers with breakers attached.
The DMX Output is an optoisolated, buffered, loop-thru for driving other DMX devices.

Output data availability is indicated by a small-green flickering DMX Output LED.

## MANUAL TEST CONTROL

The circuit breakers may be manually controlled by the TEST switches on each board.
The test switches work in the absence of a DMX signal. A valid DMX signal, indicated by a flashing large-green Receiving DMX LED, overrides the test switches.

## Emergency DMX Override

see above right

NOTES

All non-dimmed lights need a power panel.
Now have as many DMX512 controlled circuits as you need in the same panel.
You can mix DMX controlled, motorized branch breakers with standard QO breakers for a one-panel solution. LynTec DMX panels are modular and field expandable.

## BENEFITS of LynTec LC Lighting Control series Power Panels

## $\checkmark$ <br> Reduced installation labor - electrician friendly

- One wall-mounted, DMX controlled power panel feeds AC power to all un-dimmed circuits.

## ( Low power consumption

- BMB (Bolt-on) and MB (Clip-on) series motorized circuit breakers require no holding current (like DC relays) or heat sinks (like solid state relays).
Runs cool - lasts long.
- Motorized breakers available in 15, 20 or 30 Amp - 1, 2 or 3 poles.

## - Multiple universe control

- Optional control of up to 5 universes depending on model.

## LynTec

LC series Lighting Control panels add DMX addressable branch circuit control to the functions normally found in a Load Center or Panelboard.

## How they work

Each motorized branch breaker is DMX512 addressable.

DMX command set for each circuit
ON
OFF

## Delayed OFF

1 to 5 minute delay for cool-down.

## BLONK

A long blink of 8 seconds.
A single command for resetting an unresponsive luminaire.

As well as
Controlled All ON test function
Sequenced on to limit inrush current.
Controlled All OFF test function

## All

## D SQUARE D

Panels

## Who is LynTec?

Ask any sound contractor. Chances are, they'll tell you that LynTec pretty much wrote the book on remote controlled, sequencing power systems for the installed sound industry.
LynTec sequencing can be found in high-profile venues where reliable power control is mission critical. Stadiums, arenas and performing arts centers hosting national exposure events have been sequenced on and off by LynTec power panels for over 15 years.
Now, LynTec brings that same expertise to non-dimmed DMX power control.
Using the same proven panels and motorized circuit breakers, LynTec now offers a broad product line with a new DMX512 control system for lighting.

# Specifier's Guide for LynTec Lighting Control Panels 

## Load Center and Panelboard part number explanation

Load Center - Panelboard - What's the difference?
Panelboards are the electrician's choice because they have 3 times the wiring space.
Panelboards are used when bolt-on breakers, 200\% neutrals or high circuit counts are required.
Load Centers are typically used where the circuit count isn't high, offering the lowest cost.

## 3 Phase Panelboards 400 A Panelboard

 LA36400, 3 pole, 400 Amp main breaker ( 115 kVA ). 10kAIR [Amps Interrupt Rating] Optional main breakers - call for price and delivery. -MLO (Main Lug Only) is an option.225 A Panelboard
The standard LCP 341-xx has a JGP36225, 3 pole, 225 Amp main breaker ( 65 kVA ). 65k AIR [Amps Interrupt Rating]. Optional main breakers [All 65kAIR]
125A ..... -MHG3125 (36 kVA transformer)
150A ..... -MJG3150 (45 kVA)
175A ..... -MJG3175 (50 kVA)
200A ..... -MJG3200 (60 kVA)
-MLO (Main Lug Only) is an option

## Multiple DMX512 Universe Option

LynTec Lighting Control panels have the option of multiple universe control. All LC-10 boards service up to 10 - one, two or three pole motorized breakers. The first/top control board is always a LC-10M Master board. The Master board has the opto-isolated DMX512 input and opto-isolated, buffered, feed-thru output components.

In a standard one-universe system, the subsequent boards are slaves. The lower-cost, LC-10S Slave boards have their own starting address, but derive their opto-isolated DMX data from the Master board above.
When multiple universes are desired, two or more LC-10M Master boards are supplied.
Each universe requires a Master board. Any Master may have one or more subsequent slaves. See page 3 for possible board counts in each type panel.

Please include Branch Breakers to complete your specification.

## Load Center Main

 Breaker Options
## Large 3 Phase Load Center

The standard LCLC 341-xx has a factory installed, 3 pole, 225 Amp main breaker ( 65 kVA transformer) [25kAIR Amps Interrupt Rating].
Optional main breakers [All 65kAIR]
150A ..... -MQD3150 (45 kVA)
175A ..... -MQD3175 (50 kVA)
200A ..... -MQD3200 (60 kVA)
-MLO (Main Lug Only) option: We only stock LCLC panels with main breakers. If your specification requires a
-MLO we will provide it at the same price as the standard panel.
Higher Interrupt Current Option LoadCenter: QGL32xxx series 65 k AIR main breaker- $150,175,200$ or 225A
Add the H to the model type. Example: LCLCH 341.

## Small 3 Phase Load Center

The standard LCLC 326-xx has a bracketretained, clip-on, back-fed, 3 pole, 100 Amp main breaker.
Optional main breaker sizes available:

- 30A .......-M3030 (7.5 kVA transformer)
- 35A .......-M3035 (10 kVA)
$+50 \mathrm{~A} . . . . . .-\mathrm{M} 3050(15 \mathrm{kVA})$
+ 70A .......-M3070 (20 kVA)
$+90 \mathrm{~A} . . . . . .-\mathrm{M} 3090$ (25 kVA)
. 30A \& 35A: 10kAIR
+50A up: 22kAIR (Amps Interrupt Rating)

## UnMotorized circuit breakers for un-controlled circuits

BUMB-10, -15, -20 or $\mathbf{- 3 0}$ are Bolt-on, 10, 15, 20 or 30 amp single pole.
Square D QOB110, QOB115HM, QOB120HM or QOB130. - 15s \& 20s are High Magnetic.
UMB-10, -15, -20 or -30 are Clip-on, 10, 15, 20 or 30 amp single pole.
Square D QO110, QO115HM, QO120HM or QO130. - 15s \& 20s are High Magnetic.

Circuits controlled by one or more LC-10 Lighting Control boards
Each LC-10 board has 10 drivers capable of driving one 1, 2 or 3 pole BMB or MB series motorized circuit breakers. Each breaker has its own individual DMX512 address. The motorized breakers may be located in any open slot in the panel.
Bold face type $=$ legends printed on LC-10 boards.
STARTING address
The STARTING address is field programmed by installing push-on jumpers.
Each board has a starting DMX address which is typically set between 1 and 503. Subsequent addresses are automatically assigned as needed, determined by how many breakers are attached to the board.

## ADDRESS SAVER

To conserve DMX addresses, the LC-10 board only assigns subsequent addresses for breakers it locates at power-up. At power-up, the board scans and pulses all breaker connectors from 1 to 10. Each breaker load found is assigned the next subsequent address regardless of its numerical position.

Empty connectors are skipped to save addresses.

## EXAMPLE

If the STARTING address were set at 301, the number $\mathbf{1}$ position would be DMX address 301.

If the second connector had no breaker connected, it wouldn't draw any control current during the power-up scan. It would be skipped and wouldn't be assigned a DMX address.

The third and fourth connectors have breakers and would be assigned DMX addresses 302 and 303.
To avoid confusion, we would suggest that you not leave spaces except after the last connected breaker. Then your existing breaker DMX addresses won't change if you add a breaker. In the above example, if you were to plug a breaker into the empty \#2 position and re-scan, those breakers that had addresses 302 and 303, would be reassigned new addresses of 303 and 304 for your convenience and amazement.

## NOTE

If a breaker is plugged into a connector after power-up it will be ignored until a new power-up scan is run by cycling the DMX CONTROL POWER breaker off for at least 3 seconds.

## Indicator LEDs

## Amber POWER LED

Power to each LC-10 circuit board is indicated by the amber POWER LED.

## Numbered Green LEDs, 1-10

Green numbered LEDs, adjacent to each breaker connector, light when the circuit breaker motor has been pulsed on. When a "delayed Off command" is executing, the breaker's LED will flash.

## Red warning LED

Low Voltage, INVALID address or No Breakers Attached
Low Voltage $=\mathrm{A}$ fast red flash indicates AC line voltage is below 105 VAC - No DMX reception or execution.
INVALID address $=$ A slow $(1 \mathrm{~Hz})$ red flash indicates an invalid address setting totaling of more than 512.
Example: With a STARTING address set at 504 and 10 breakers attached, the total would be 513, exceeding DMX512's capacity.
No Breakers Attached = A continuously lit red LED indicates no breakers were found at the time of the power-up scan.

## Green Receiving DMX LED

When the Receiving DMX LED is flashing, the system is active and ready to execute DMX commands. The Receiving DMX LED stays lit during command execution.

## Green DMX Output LED

Flickering LED indicates data presence at the Buffered DMX Output.

## Brown-out protection

Five seconds after power stabilizes above 105 volts, the board begins receiving DMX signals indicated by a flashing green Receiving DMX LED. When the Receiving DMX LED is flashing, the system is ready to execute DMX commands. A fast flashing red LED indicates the power hasn't been above 105 volts for the last 5 seconds and the controller is waiting for the power to stabilize before resuming DMX reception.
Motorized Circuit Breaker Low Voltage Connections
Each motorized breaker derives its control power through a 60" - 3 conductor wire. This low voltage, 600 volt insulated, cable is field connected to the Lever-latch 3 pin plugs. The Lever-latch plugs fit into numbered receptacles on the circuit board/s.

## DMX CONTROL POWER

The DMX CONTROL POWER circuit breaker, mounted in the lower right position in the high voltage section of the panel, is connected to a UL listed 120v to $24 \mathrm{v}, 40$ VA transformer mounted inside the low voltage cabinet.
This 10 amp un-motorized breaker should be left on continuously. This circuit breaker is used as an approved, switchable connection method to the high voltage. The $\mathbf{U L} \& \mathbf{U L}_{c}$ listed transformer is impedance protected with an internal thermal fuse.
Each sequencer board is protected by an on-board 3AG 3/4 amp fuse.
Power required: $50 / 60 \mathrm{~Hz}, 6.5$ watts per board with 10 breakers in the on condition. 33 watts maximum per panel.

## DMX PROTOCOL for LynTec LC series

| \% Circuit Function - NOTES |  |  |
| :---: | :---: | :---: |
| 0 | 0\% | No change - Keep previous command. A zero or CLEAR command retains the command preceding it. <br> After a 0 command, this channel awaits a new command. |
| 1-24 | 1-9\% | All breakers OFF - 0.25 second step rate. DMX Override Test, All OFF command. Must be sent to first address on each board. Overrides all other DMX commands. |
| 25-50 | 10-19 | This breaker, Instant OFF. When sent to all breaker addresses simultaneously, they turn OFF at a .25 second step rate. |
| 51-65 | 20-25 | This breaker, OFF in 1 minute. Green breaker LED will flash during countdown. |
| 66-80 | 26-31 | This breaker, OFF in 2 minutes, flashes during countdown. |
| 81-95 | 32-37 | This breaker, OFF in 3 minutes, flashes during countdown. |
| 96-110 | 38-43 | This breaker, OFF in 4 minutes, flashes during countdown. |
| 111-126 | 44-49 | This breaker, OFF in 5 minutes, flashes during countdown. |
| 127-133 | 50-52 | BLONK - 8 second LONG blink. A 8 second power off reset for unresponsive luminaires. Must be preceded by an ON command - NOT an All On. |
| 134-191 | 53-74 | This breaker, Instant ON. <br> When sent to all breaker addresses simultaneously, they turn ON at a .25 second step rate. |
| 192-223 | 75-87 | All breakers $\mathrm{ON}-0.25$ second step rate. DMX Override Test, All ON command. Must be sent to first address on each board. Overrides all other DMX commands. |
| 224-255 | 88-100 | All breakers $\mathrm{ON}-1 \mathrm{sec}$. step rate. |

## ARCHITECTS \& ENGINEERS SPECIFICATIONS

for PDF and Word file links
see http://www.lyntec.com/139-0378_LC_Brkr_A\&E_Specs.pdf

# QO-PL (Plug-on), QOB-PL (Bolt-on) Powerlink ${ }^{\circledR}$ Remotely Operated Circuit Breakers <br> (Use in Type QO Load Centers and Type NQO, NQOB, and NQOD Panelboards) 

Retain for future use.

## REQUIREMENTS

## Remotely Operated Circuit Requirements

## A. DANGER

HAZARD OF ELECTRIC SHOCK, BURN, OR EXPLOSION.

When servicing a branch circuit fed by a remotely operated circuit breaker, move handle of remotely operated circuit breaker to OFF position. Do not rely on remote operation to open circuit breaker.

Failure to follow these instructions will result in personal injury or death.

## CIRCUIT BREAKER INSTALLATION

## DANGER

## HAZARD OF ELECTRIC SHOCK,

 EXPLOSION, OR ARC FLASH- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E.
- This equipment must be installed and serviced only by qualified electrical personnel.
- Turn off all power supplying this equipment before working on or inside equipment.
- Always use a properly rated voltage sensing device to confirm power is off.
- Replace all devices, doors, and covers before turning on power to this equipment.

Failure to follow these instructions will result in death, or serious injury.

## See page 2 for LynTec part number explanation

POWERLINK ${ }^{\circledR}$ QO(B)-PL Remotely Operated Circuit Breakers require a power supply capable of delivering at least two amperes at 24 Vdc for a minimum of 50 milliseconds. One-, two-, and three-pole circuit breakers all have one internal motor, and power requirements are the same regardless of the number of poles and ampere ratings.

The required power supply ampacity and control device contact rating are determined by the number of circuit breakers to be switched simultaneously (i.e., four circuit breakers switched simultaneously require a power supply and a control device contact rated 8 amperes minimum). The control device may be either a normally-open (NO)/ normally-closed (NC) contact; a single-pole, double-throw switch (SPDT); or other three-wire control device.

1. Turn off all power supplying this equipment before working on or inside equipment.

All LynTec supplied breakers have special 60" control wires. (Square D standards are 18".)
figure below)

4. Except for remotely operated connections, QO(B)-PL remotely operated circuit breakers are installed in a panelboard/load center the same as conventional QO(B) circuit breakers.

Connection of remotely operated circuit (refer to the figure on next page)
5. Assure that power supply and control device meet requirements listed under "Remotely Operated Circuit Requirements."

## CIRCUIT BREAKER INSTALLATION

## CAUTION

## HAZARD OF CIRCUIT BREAKER DAMAGE.

Connect the 24 Vdc remote control wiring as shown on this page.

## Failure to follow these instructions can permanently damage the remotely operated circuit breaker.

## LynTec <br> part numbers

MB series motorized circuit breakers (Snap-On) May be used in LCLC, LCP, MSLC, MSP, SLC or SP series panels.

BMB series motorized circuit breakers (Bolt-On) Use only in LCP, MSP or SP Panelboards
All BMB \& MB series breakers have Square D part number suffix of -5393 indicating a special 60 inch lead length for remote control wires required to connect to LynTec control boards in low voltage cabinet.
** $=$ Stocked items

www.SquareD.com
6. All wiring and splicing must comply with applicable code requirements for Class 1 circuits. Refer to paragraph 373-8 and article 725 of the National Electrical Code.
7. Three \#18 AWG control wires are attached to the remotely operated circuit breaker for connection to the power supply and remote control device and should be cut to the required length to reach the splice connections. Use \#18 AWG or larger conductors with 600 V insulation and approved wire connectors for splices.
8. Connect the black lead of the remotely operated circuit breaker to the negative (-) terminal of the 24 Vdc power supply. Connect the red lead of the remotely operated circuit breaker to the positive (+) terminal of the 24 Vdc power supply. Connect the white lead of the remote control device. The remote control device provides connections between either positive or negative potential of the power supply and the white wire of the remotely operated circuit breaker, as appropriate.
9. Applying the positive potential of the power supply to the white wire (contact closure between the red wire and white wire) will operate the remote mechanism of the circuit breaker to the OFF position. Applying the negative potential of the power supply to the white wire (contact closure between the black wire and the white wire) will operate the remote mechanism of the circuit breaker to the ON position. A control circuit utilizing a normally open (NO)/normally closed (NC) contact is illustrated below.

NOTE: The remote mechanism will not move the circuit breaker handle. Also, the remote mechanism cannot turn power ON when the circuit breaker is tripped (VISI-TRIP ${ }^{\circledR}$ flag indicator showing) or when the circuit breaker handle is in the OFF position.

## Installation of the trim and operational checks

10. Remove corresponding twist-out from panelboard trim and replace trim.
11. Turn power to panelboard on.
12. Turn remotely operated circuit breaker handle to the ON position.
13. Turn power to the remotely operated circuit on and test this circuit, turning remotely operated circuit breaker off remotely, then on remotely. If power to remote controlled circuit breaker load does not switch off and on, turn off power to remotely operated circuit and panelboard and check wiring.

NOTE: A power supply is available from Square D Company, Cat. No. QOPLPS (plug-on) or QOBPLPS (bolt-on).

Splice not normally required with

Electrical equipment should be installed, operated, serviced and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.
